MEMORANDUM

PRODUCIDO POR

PARA INFORMACION DEL señor Jefe del Departamen-
to Asesoramiento en Servicios
Ing. Miguel Angel Basualdo

Ing. Leandro Barredo

BUENOS AIRS. 8 DE abril DE 1987

ASUNTO: "Energías No Convencionales en Cortaderas-Catamarca"

Se remite para su incorporación a la Biblioteca un ejemplar del trabajo del epígrafe, realizado por técnicos de este Departamento.

Atentamente.

De acuerdo
Leandro Barredo
MAB
08.04.87

1 - Introducción

A partir de la solicitud realizada por la Subsecretaría de Planificación y Coordinación de la Provincia de Catamarca, se iniciaron los trabajos previstos en el Plan de Acción del estudio "Proyectos para la instalación de eologeneradores en la Provincia de Catamarca".

El estudio, del cual el presente trabajo constituye una primera entrega, definirá las características técnicas de las instalaciones que se desean erigir en las localidades de Cortaderas y Antofagasta de la Sierra de la Provincia de Catamarca.

Como primer paso para la instalación de unidades de generación de energía a partir del viento, se requiere una evaluación del recurso natural lo más detallada posible. Las condiciones existentes en Antofagasta de la Sierra han permitido sólo la realización de mediciones durante seis meses, pero los datos recabados, por el grado de coherencia de los mismos son suficientes para la definición de los vientos en el lugar y para definir el tipo de instalación a realizar.

2 - Mediciones

Con la colaboración de la Gendarmería Nacional, se realizaron mediciones en un anemómetro instalado en el Cerro Negro, a 90 metros sobre el nivel de la plaza de Antofagasta de la Sierra, en el lugar más apropiado para la instalación futura de un eologenerador. El período de medición abarca los meses de noviembre a abril. No obstante por la información recabada de los moradores, se concluye que en el invierno no se registra una modificación notable en los promedios diarios.

El anemómetro se instaló a 2,30 metros del nivel del suelo, el que carece totalmente de vegetación. Se trata de un anemómetro integrado a molinete, con tres cazoletas montadas sobre un eje vertical, con indicación en decenas de metros.

El registro se tomó cada 24 horas aproximadamente. Los valores reunidos fueron luego procesados para obtener los promedios mensuales y totales, y a partir de éstos se reconstruyó una distribución aplicando los criterios de Weibull y de Rayleigh.

La localidad de Antofagasta de la Sierra está situada a una altitud de 3.400 m.s.n.m., para esta altitud la densidad del aire es de aproximadamente $0,87 \text{ Kg/m}^3$ en comparación con el valor de $1,225 \text{ Kg/m}^3$ sobre el nivel del mar. Esta diferencia debe tomarse en cuenta al evaluarse las unidades generadoras cuya potencia está referida normalmente al nivel del mar.

3 - Procesado de las mediciones

Las mediciones realizadas se han listado incluyendo el nombre del personal de Gendarmería que se encargó de la misma.

En el listado se han eliminado algunas mediciones que no ofrecían coherencia respecto del resto de los valores. Como resultado el conjunto quedó reducido a 45 valores. En el primer listado se indica el día, mes y hora de la observación y el valor del registro acumulativo del anemómetro.

Al registro original CONTEFEC de seis dígitos se le incorpora un dígito inicial estimado en el segundo listado, bajo el rubro CONT. El dígito agregado es M. Los rubros DIFM, DIFH y DIF indican respectivamente la diferencia en minutos entre cada medición, la diferencia entre los registros CONT, y el promedio en kilómetros por hora calculado a partir de los valores anteriores.

Se puede apreciar la constancia relativa de los promedios diarios. El total de las mediciones nos da una media, obtenida a partir de los promedios diarios de 23,8741 km/h con una desviación standar de 10,4859 km/h. El análisis estadístico se repite para cada uno de los meses en que se realizaron mediciones.

Las funciones de distribución de Rayleigh y Weibull son métodos para obtener la curva que define la probabilidad de cada intervalo a partir de los valores estadísticos.

Tanto las funciones como las funciones acumuladas son aproximaciones a la realidad, que por el grado de coherencia que ofrecen en este caso pueden tomarse como válidas. En todos los gráficos el eje horizontal está dado en km/h.
